

Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The subjects included all employees of a large manufacturing company who had been employed at least one year. A questionnaire was sent to each employee asking about symptoms of musculoskeletal disorders and work-related factors. The results showed that the prevalence of musculoskeletal disorders was higher among non-manual workers than manual workers. This difference was most pronounced for neck pain, shoulder pain, and back pain. The results also showed that the prevalence of musculoskeletal disorders was higher among female workers than male workers. This difference was most pronounced for neck pain, shoulder pain, and back pain. The results also showed that the prevalence of musculoskeletal disorders was higher among older workers than younger workers. This difference was most pronounced for neck pain, shoulder pain, and back pain.
